Process Of Screen Printing

Screen printing is one of the initial methods used in printing process. In this process, the ink or any other printing medium is passed through a screen or 'mesh' that has been fixed on a frame, and a stencil has been applied to it. The image that needs to be imprinted is determined from the stencil openings. For the different colors, different screens are prepared and the process is repeated.

Silk screening or serigraph also involves screen printing. In this, the stencil method of the print making imposes a design on the screen of silk or any other fine mesh and the empty areas are covered with an impermeable substance while the ink is put on the printing surface through the mesh. The silk printing was the traditional method but now it has been replaced with the polyester for screen painting.

The screen printing first appeared in China during the rule of Song dynasty. The Asian countries started using the screen printing process in thirteenth century and advanced it further by combining the screen painting with block printing and paints. In late 1700s, the Europe started using the screen printing process but it gained wider acceptance much later as the silk was not available in the Europe at that time.

In the United States, the screen printing was popularized by artist Andy Warhol, he screen printed actress Marilyn Monroe in '62. A rotary machine was patented by Michael Vasilantone in '60 to print logos and team information on bowling garments but shortly, started printing on t-shirts. It was soon licensed by many manufactures for screen printing of garments making the rotary garment printing machine as a popular device for screen printing. In the United States, screen printing on garments account for almost half of the screen printing activity.

The printing on the canvas with the help of the screen-printing also became popular with the artists. Warhol, Robert Rauschenberg and many other artists have made use of screen-printing on the canvas. The commercial as well as the fine arts industry is using this screen printing industry to increase their profits and they use it to make prints on the CD and DVD covers, t-shirts, hats and also on the metals and many more things.

Currently, graphic screen printing is used in creation of mass or large batch production graphics such as posters or display stands. The screen printing is more suitable for printing on non-porous surfaces like ceramics and metals, curved surfaces like bottles and cups and also for short print runs.

The Corporate give different types of gift items to their employees every year to their employees or clients in recognition of their work. There are many different gift items available that can be used as corporate gifts like screen printed mugs, t-shirts, folders, ties, and many more.
