A Look At Spam Bully The Spam Killer

One really good thing about technology is how it was able to make the world a lot smaller through improved means of communication.

The invention of the e-mail is really very revolutionary however, there are a few problems linked to it as well.

Email has become very invaluable through the years but sadly a few people have made this mode of communication very inconvenient for most of us. The number one problem when it comes to email is spam.

Spam is a problem among e-mail users with spam totaling to 80 to 85% of all e-mails worldwide. Spam is any kind of unsolicited e-mail or junk mail.

There are plenty of programs that can filter one's inbox and make sure that all the spam gets marked and segregated.

But even if there are plenty of anti-spam softwares, you will really have to sift through a couple of them to find the one that really delivers.

Spam Bully is the newest anti-spam program from the Bayesian spam filters. Spam Bully is a program that is developed for different outlook and outlook users who are having experiencing problems with spam and what their inboxes to be filtered.

Targeting a specific market is the company's way of being competitive.

Spam Bully is different from the other anti-spam programs because of it can "learn" from the user. Spam Bully does not mark emails according to its own definition of what spam is but rather on how the user sees an email spam.

Spam Bully can track any pattern made by the user when he marks the emails as spam or not himself, learn from this pattern, and do the filtering automatically from there.

Downloading Spam Bully does not typically take long as the program file is only 4.5mb. However, this may have to depend on your internet connection speed.

The installation went smooth for me but once you get everything running, the program will have to take a look at your system to "optimize" which will take a couple of seconds.
