# **A Variety Of Unique Items That Can Be Referred To By The Name Blaster**

There are quite a few different definitions for what a blaster is. The word has come up over and over in science fiction, it has shown up in our machinery, and there are even people who go by the name. Most people probably had an image pop to mind when they hear the term, and that image was probably something that was taken from popular culture throughout the last fifty years or so. Picturing a robot holding an odd shaped gun in front of an alien space craft is one common image. The word seems to represent an idea of the future that was supposed to arrive that never came to pass.

In pop culture, a blaster is a gun that shoots some sort of energy. This can be any sort of energy, depending on the author or the creative mind behind it. There are three or four different types that are most popular, though, that have likely been used the most.

The first type is based on what is called plasma. Plasma, in modern terminology, is what we call specific part of the blood that is in every living animal and human. In science fiction, though, it can be a number of things. Often it will be represented by a greenish glob of light that comes from the barrel of the gun. Depending on the type of story you are enjoying, this may be incredibly deadly or it can be something that merely temporarily disables an opponent.

The second type uses the power of sonics to destroy or incapacitate an enemy. The sonics are filtered through the gun and come out in such a high powered frequency that they can stun, maim, or explode an opponent. Usually this type is used as a non-lethal weapon, but it can sometimes be pumped up to have some incredible power that can literally shake people apart by the seams.

Lasers are the most common and the most recognizable. Real lasers are beams of light that are condensed into strong beams. These beams aren't nearly as powerful, yet, as the ones that come out of the guns in science fiction. The ones that even come close are so large that they would never fit into a convenient hip holster.

As stated earlier, the term does apply to things that people may use in their day to day lives. A sand blaster is used for many things in the construction field. The sand comes out and smoothens out rough surfaces or gives them a deep very deep clean.

Fictional characters have gone by the name. Including one from the popular morphing robots franchise. The name, when used, does seem a little dated. This is because the term has fallen into more common usage since it was original used to name these characters, who are now starting to get a little older.

Whatever the term means to you, and probably a dozen more things are around that have gone by the name in the past, it is a term that is probably going to stick around. Every decade or so there is something new that goes by the name. Safe to say, blaster isn't going anywhere.

To obtain the best [advertising](#) to [target](#) the best marketing, you need to find the best program or company that can help. Many people use different types of marketing to obtain to the top of any search engine. Internet traffic is important for a successful online business.
