You Can Help To Save The Planet By Installing Double Glazing

Installing double glazing in your own home or office can help you to reduce your carbon footprint. But what is a carbon footprint? Well, this is usually worked out by looking at how you live and how you spend your recreation. How many tonnes of greenhouse gases, especially carbon dioxide do you use in a year? It might surprise you to learn that by simply installing double glazing in your home or office, you can dramatically cut down this footprint.

A quick way to work out how much carbon dioxide you use is to go to a website which is dedicated for this purpose. It asks you details such as how many car journeys you make each year and how many holidays you take. Examples of these things are what make up your primary carbon usage. This also takes into account how energy efficient your home is. For example, how much energy it loses just by your daily activities, through the windows and the roof etc.

Next, it asks questions about your indirect carbon usage. This is your secondary footprint and involves things such as where your produce comes from. Do you buy sugar produced in your own country or shipped in from far away for example?

Double glazing is an excellent way to trim down your carbon footprint. They act as insulators for your home. They trap air between two panes of glass - a sort of mini greenhouse effect, and keep your house warmer.

By using double glazing you immediately cut down how much energy is lost through your windows. You immediately cut down your heating bills, and immediately reduce the size of your carbon footprint.

If we all decide to do this in our homes, then not only can we be a little richer, we can know that we are helping to save the planet too!

Learn the important details you will want to find a reliable [sash window restoration company](#) fast and easy! The professionals at [Sash Windows London](#) will provide you with the quality of service you want.
