The Amazon Kindle

If you're considering selling second hand or used books, it's likely that you've heard of or considered using Amazon's Market Place to sell them through by setting up a seller account.

After running Amazon & eBay side by side for a month, I've removed all my Amazon listings. The main reason for this is because the Amazon market place is, I think, dying. when you log onto Amazon, and check their listings, the lowest price for the book you're selling is likely to be just a penny.

The next question that arises is how one may go about finding or at least accessing the latest Amazon deals? This can be achieved by the functional searching facilities and options available directly on the site, however often times this search may prove to be daunting to those not familiar with some of the tricks and techniques available to the end consumer and user of the website. To this end a number of comparative shopping sites have come into existence to offer the discerning online buyer a structured and relevant product listing service or portal.

Not good enough. In addition to this, Amazon sales are far slower compared to eBay, and it's perhaps fortunate then that I make a profit on every book sold at eBay, even though my prices start at 99 pence here.

There are only a few downsides to the Amazon Kindle. There is no place to rest your hands. There is no built in light, so you will have to in the light to view it. It also can be a bit on the high price end.

This represents significant value and savings for the discerning customer, by reporting regular returned results based upon the selling popularity and markdown aspects mentioned. The regular user of azPriceWatch.com stands to benefit directly from such automated reporting by securing products that are relevant to the purchaser, and specific to their areas of interest, found within the latest Amazon deals.
