# Choosing The Best Web Video Hosting Service

The technical features of a video website have to be considered carefully when you think about web video hosting. You can decide the choice of the video website according to the features available and whatever is of utmost importance for your storage needs.

The file size limits of the sites allow you to upload your data. Every video hosting site has a limited file size and when you want to upload your video on it, you have to do it in a compressed form. It is possible that the video may lose out on quality if you have to compress it to a great degree. Sometimes there are no limits of the size of the file, and it can be ideal to upload your master video file, but it may cost you an enormous amount of time.

Before you upload your video to a host, you must check the clarity and brightness of the videos which are hosted on that site. All videos are compressed and the compression quality of the video website is largely responsible for the quality of the video shown on the site. A poor compression quality will obviously give you hazy and dull videos, even if the master video is of a good quality.

Storage space is limited on some sites for video hosting. If the storage space that you have bought is limited, you have to keep deleting the videos which you had uploaded earlier, to make space for the new ones. The option for you is to buy additional space to upload your new material. For some websites there is no fixed space or limited number of videos that can be uploaded, but the quality may not be very good, and requires to be checked out.

Like unlimited storage space, many video sites have a large number of video formats. Sometimes just a direct upload from the camcorder and cell phone is also possible. Choose a format which is suitable for your video upload. Also, the website should have a video glossary which has compression formats and codec.

As a format for video website viewing Flash is most commonly used as most computers have it installed, not only because it is quick, but because it is also easy to play. The other commonly used video format is iTunes, which can also be easily used.

Some hosts permit downloading and some don't. According to your choice, whether you want your video to be downloaded by users or not, you can choose the website. Some sites even have editing features, which may be useful for you if you want to make some changes on the video later. You can then just change it on the website, instead of doing it on your PC and then uploading the whole video once again.

There is a list of online sites that have listings of various places to host your videos which includes all of the technical features of each website. It is a great help to make your choice of the hosting site that will best suit your particular needs.
