Polar Shifts 2012: Can It Be Real?

Have you heard of the Doomsday theories for year 2012? What can "Polar Shifts 2012" possibly give us then? And while most of us still do not really understand what Polar Shifts 2012 actually brings to our lives, then perhaps, it is necessary to take a deeper look at it.

There are actually several theories that are connected to this concept and scientists refer to the "Polar Shifts 2012" as a "geomagnetic reversal" on Earth; or in layman's term, the irregular changing of the magnetic fields on our planet. However, scientists have diverted their energies and attention more on the other theory which is a little bit analogous to the notion of the geomagnetic reversal, the hypothesis of the shift in cataclysmic poles.

Hypothetical Shift In Cataclysmic Poles Defined

It has been defined as the breaking up of the two so-called true poles; the true North and South poles which are actually the ultimate concerns of a polar shift, or those changes on Earth's angle as it rotates. And as we have studied earlier on in our lives, Earth rotates on a slant; yet, there are philosophers who continuously claim that the earth actually turned around on a straight vertical axis millions of years have passed, saying that it only proves that the axis of our planet has truly changed.

Probable Grounds For Occurrence Of Said Polar Shifts

And two known scientists Albert Einstein and Hugh Brown have argued that such polar shifts come 2012 will be triggered by the dissolution of the icecaps in the two poles which will eventually bring about certain imbalance on our planet; which will permanently affect the way it rotates.

Other Scientists And Their Own Versions Of The Theory

And although other great scientists like Charles Hapgood agreed with the two scientists' theory on the thawing out of the ice caps, he eventually disputed that the liquefying of the said ice caps into water is not sufficient to trigger a polar shift on Earth.

He stressed that our planet actually changes position every 5,000 years after having no signs of polar shifting for more than 30,000 years; which drives him to point out that it is actually the Earth's crust as well as its mantle moving that brought about the said polar shifting, and never the dissolution of the ice caps.

Yet, there is another philosopher named Immanuel Velikovsky who stressed that these polar shifts come 2012 are possible when another planet, Planet X, comes near to the Earth and makes an impact great enough to cause changes in the earth's axes and rotations. He also reiterated that such polar shift will cause major catastrophes like earthquakes, devastating typhoons and tidal waves. Nevertheless, although such theories were backed up by certain incidents documented happening in the past, such hypotheses were simply dismissed by the scientific community.

2012 Potential Events

Experts conclude that come year 2012, there is the possibility of a major arrangement of the heavenly bodies and that Planet X may indeed come really close to Earth that will prompt a fast and radical polar shift. That being the case, there will certainly be big disturbances such as destructive tsunamis, volcanic eruptions, massive typhoons as well as high-intensity earthquakes to be caused by these Polar Shifts 2012. And whether these hypotheses are real or not, it would still be best to always take the best of care when that time comes.

To know more about [Polar Shifts 2012](#) would mean arming yourself with survival tips essential to survive the foreseen catastrophes come 2012. There are several resources available online by which you could learn more about polar shifts and therefore, endure 2012's forecasted catastrophes.
