# **XSite Pro The Small Internet Business Choice**

Starting out many years ago only a few website design programs were available for the average website owner. Either you hired a professional or you learned how to program in HTML, the Internet programming language. Needless to say it was tedious and frankly, pretty frustrating just getting up the most basic of sites. It would take hours upon hours of trial and error to get a site up and running. The other drawback was of course broadband was not yet available everywhere and you needed to do all of this with a dial-up line. You can imagine that didn't make anything easier. There was always a sense of pride that you were able to conquer html and build a site, but it was bittersweet because the end result was pathetic.

Since then life on the Internet has changed and so has the process of developing websites. In the late 90's and the early part of this decade we saw the first WYSIWYG (What You See Is What You Get) programs emerging. they were a heck of lot better but still confusing. One of the biggest issues was creating a site that looked and performed the same across all operating systems and web browsers.

And then a break-through occurred. I was reading through an article, a number of years ago, online and found a link to XSite Pro, a new generation of website design software. I was curious so I click through and was impressed by the features, so I bought it. This was XSite Pro version 1. I was absolutely impressed with this creative marketing tool. For the longest time I was painstakingly trying to build one website over a period of weeks and now I could knock out multiple niche websites in a few hours. these weren't simplistic websites but AdSense ready sites with impressive graphics and functionality.

The first version of Xsite Pro introduced a completely new and more intuitive approach to creating a website that anyone could understand, even someone like me with no html knowledge. This first version was almost a Godsend because it was so simple. The ease at which you could create websites was awesome. I was hooked.

About two years ago Intellimon, the developer of XSite Pro, Introduced XSite Pro 2. This was a complete overhaul of the first version, not that it needed an overhaul, adding in some new functionality that would set XSP apart from everything else. Functionality such as utilizing RSS Feeds and creating your own RSS, and dozens of other functions that help you to create professional websites in minutes.

One thing that the developers of XSP 2 stress is that you still don't need to understand one line of html code to build a super website within hours. If you are an Internet marketer selling multiple affiliate products you will now have a distinct advantage with XSP 2

I can't begin to tell you all of the great features of XSite Pro 2 but I've put a link to the features page for you to get more information. The other feature I think that you will really appreciate is the cost, it's really within reach of most all website business owners and marketers. By the way if you are a website marketer building one page sales pages. You will appreciate the ease and speed of creating sales pages in XSite Pro. Did I mention that there are dozens of Sales page, affiliate and small business templates built into to XSP 2?

You could start to take an expensive training course on how to use some of the most popular and costly web design programs available today or you can go the the links I've provided below to get the whole rundown on XSP 2. Do yourself a big favor and click below first.

Check out he features page for XSite Pro 2 to see a complete listing of all of the [XSP 2 features](#). Already sold? Go directly to the [XSP 2 purchase page](#). You will not be sorry that you did. You can get a unique content version of this article from the Uber [Article Directory](#).
