# **Main Dissimilarities Between Indoor And Outdoor Banners**

Banners have become highly fashionable in the economic world when it comes to marketing. They practically invade our world, embellishing it whether we are outdoors, or indoors. Being rather cheap and having a strong impact on the public they are a very popular means of advertising. They represent the best way of advertising your products.

Outdoor banners have various purposes. They may be seen wrapped around the buildings, or just hanging on them, situated on the side of the road, or surrounding football fields. But the general public's favorite outdoor banners are the ones which appear at parades, having different shapes, vivid colors and flying above everyone.

Inside the churches, in reception halls, in schools and in the malls we often encounter indoor banners. Their purpose is very clear for every viewer. They have a target audience well defined while outdoor banners are meant for the general public.

The main dissimilarity between indoor and outdoor banners is the material. A durable material is required for outdoor banners. It shouldn't be torn by the wind or faded by sunlight. The small holes in mesh banners allow the wind to pass through so the material is fit for large format banners in windy conditions.

A good choice for indoor banners is fabric. Bright lights or camera lights might be reflected by a glossy material, but fabric is matte and it allows the public to see the print on the banner. It is not as resistant as vinyl and that is a good reason for this material not to be chosen for outdoor banners. A fabric outdoor banner is more likely to have its print faded in a short time by the influence of natural phenomenon.

Banners should be attractive because their purpose is to be seen even by those persons who are in a hurry. An expert's advice can always be a plus for the banner in terms of message, design, print and material.

The unique patented system that Soyang uses revolutionizes the display of the [banner material](#), offering a lightweight easy to use alternative.
