In today's high speed society, support workers who can fix PC's and networks, along with giving ongoing assistance to users, are vital in every part of the workplace. Industry's need for better qualified personnel multiplies, as we turn out to be vastly more reliant on computers in today's environment.

Review the following facts carefully if you think the sales ploy of an 'Exam Guarantee' sounds great value:

You'll pay for it one way or another. It certainly isn't free - it's simply been shoe-horned into the price as a whole.

It's everybody's ambition to qualify on the first attempt. Taking your exams progressively one by one and paying as you go has a marked effect on pass-rates - you prepare appropriately and are conscious of what you've spent.

Do your exams at a local pro-metric testing centre and don't pay up-front, but seek out the best deal for you when you're ready.

Paying upfront for examination fees (plus interest - if you're financing your study) is madness. Resist being talked into filling the training company's account with extra money of yours just to give them more interest! Some will be pinning their hopes on the fact that you won't get to do them all - then they'll keep the extra money.

The majority of companies will require you to sit pre-tests and not allow you to re-take an exam until you've proven conclusively that you can pass - making an 'exam guarantee' just about worthless.

Exams taken at local centres are in the region of 112 pounds in this country. Students should be very wary of forking out hundreds of pounds extra in fees for 'exam guarantees' (most often hidden in the package) - when a quality course, support and consistent and systematic learning, coupled with quality exam simulation software is what will really see you through.

We're regularly asked to explain why qualifications from colleges and universities are being overtaken by more qualifications from the commercial sector?

Accreditation-based training (as it's known in the industry) is most often much more specialised. The IT sector has become aware that such specialised knowledge is what's needed to handle a technologically complex commercial environment. Microsoft, CISCO, Adobe and CompTIA are the big boys in this field.

Clearly, a necessary amount of background information has to be covered, but core specialised knowledge in the exact job role gives a commercially trained student a huge edge.

As long as an employer understands what areas they need covered, then all they have to do is advertise for the exact skill-set required to meet that need. Commercial syllabuses are set to exacting standards and do not vary between trainers (in the way that degree courses can).

Of all the important things to consider, one of the most essential is always full 24x7 support through professional mentors and instructors. It's an all too common story to find providers that will only offer a basic 9am till 6pm support period (maybe later on certain days) with very little availability over the weekend.

Email support is too slow, and phone support is often to a call-centre that will take the information and email an instructor - who will attempt to call you within 24-48 hrs, when it's convenient to them. This isn't a lot of good if you're lost and confused and have a one hour time-slot in which to study.

The most successful trainers utilise several support facilities around the globe in several time-zones. They use an online interactive interface to provide a seamless experience, any time of the day or night, help is at hand, avoiding all the delays and problems.

Look for an educator that gives this level of learning support. As only true live 24x7 round-the-clock support provides the necessary backup.

Doing your bit in the cutting-edge of new technology really is electrifying. You're involved with shaping the next few decades.

We've only just begun to get a feel for how technology will define our world. Computers and the Internet will profoundly transform how we view and interact with the world around us over the coming decades.

The money in IT isn't to be sniffed at also - the average salary in Great Britain for the usual IT employee is considerably higher than remuneration packages in other sectors. Chances are that you'll earn a much greater package than you could reasonably hope to get in other industries.

Experts agree that there's a substantial UK-wide demand for qualified IT professionals. In addition, as the industry constantly develops, it appears this will be the case for years to come.
