To begin with, CS5 allows for big improvements to the way "paint brushes" and "painting" will function within Adobe Photoshop. We are able to use a photo (or even any image) like a web template canvas or even color palette for painting. By clicking on a certain area it is possible to simulate dipping the brush straight into paint. After that you'll be able to drag that color out to get spread around while simulating a wet brush. You can even blend shades just as much as you like, and attain a variety of effects that will provide your photos a completely new look.

The 2nd improvement lets you simulate brush physics while you're painting. An computer animated 3D brush preview can display alterations based on pressure, and rotation. This in turn will affect the ways with which the actual paint will be placed on the canvas as if you had a genuine brush. Many different presets can be found, even though you will have to have the ability to work with your imagination so as to create your own.
