Look For The Lanyard At Work

The lanyard, a simple little cord around the neck of professionals, has quite an interesting story. The lanyard was originally a military item that was used to keep soldiers from losing items such as a whistle or a weapon. Over the years the lanyard became less functional and more of a decorative or ornamental item and the number of ways in which lanyards are used has exploded over the past several years. Today lanyards are technically any type of pull cord or tether used in business.

Today many businesses require employees to wear ID badges to increase building security. Often a lanyard will be custom made with the company's name or logo to be made available to all new employees and may even be part of the company's dress code requirements. You will also find lanyards being used to hold event tickets, nametags or other items which need to be easily seen. The lanyard can be individually customized to give an employee a chance to show off a bit of their own personality while still being in compliance with a strict company dress code.

Even the most contentious employee may misplace an important item such as keys, security access cards or even thumb drives. A solution to this is to place the item on a lanyard. This allows the employee to maintain control of the item at all times without requiring their constant attention. Just because an item is small that does not mean it isn't expensive or vital to a smooth running operation. Using a lanyard can help reduce the risk of an item hitting the floor and breaking.

Safety is an important factor in industrial environments. Lanyards can actually play a role in helping keep employees safe. A lanyard is often attached to an employee and the kill switch of a piece of machinery. If something were to happen to the employee the pin would be pulled on the kill switch and the equipment would be shut down immediately. This same concept is also used in dangerous vehicles to keep them from operating if the driver were to fall out.

While you may never really think about lanyards you probably come across them everyday. A simple cord that originally had a military use is now used in so many different ways by many different people in all walks of life. The lanyard is everywhere from ID tags, to safety equipment and for keeping valuable equipment from falling to the floor.
