Do You Know The Top Five Myths Of Web Development And Design

Website design is an art that only a few can really master. All web designers must be innovative and talented, but there are a few who are more intricately involved with their vocation than their counterparts. On account of an ever expanding number of web designers looking to get into this profession, a wide range of untruths have come up. Following are some such myths.

Myth #1: It is good to have flash on the site

Flash is type of software that increases the aesthetic appeal of a web page but it isn't indispensable. Introducing flash to a web site is not the only way to make it pretty. There are several other ways such as introduction of varied colors, pictures and cartoons that can add to the aesthetics of a site. Furthermore, flash is usually quite a large software that takes a considerable amount of time for being loaded on the page. Hence, the web pages that incorporate flash take some extra time to load. Also, if you incorporate flash in a web site, the designer should make available a non-flash version to users to allow fast transmission of information in case the internet connection of the user is slow.

Myth #2: Lots of colors make the site pretty

Most web designers make a vivid use of colors to bring vibrancy to the web pages. However, an over-use of too many colors mars the overall impression of a site. It is wise to make a very careful selection and limit the usage to an utmost of 3-5 colors per page. A single color may be utilized for emphasizing the page hyper-links across a website to providing easy readability.

Myth #3: Images make the site attractive

Web designers recommend the use of images for boosting the overall appeal of a website. However, an overuse of pictures, images or cartoons kills the sobriety of the site, and serves as a major turn off for the visitors. Additionally, web pages with picture usually take much longer to load. Since the attention span of the visitors is very limited, needless clutter of images and delay in loading pages might prompt them to leave and move on to some other site.

Myth #4: Web pages look the same through multiple browsers

In contrast to the general belief, web sites tend to look different when seen through different browsers. It is important for website designers to test and review their sites using different browsers such as Internet Explorer, Chrome, Firefox,, etc for ensuring clarity, good resolution and appeal. Nowadays more users are accessing the internet on their mobile phones. Hence, designers should also incorporate mobile browsers in their review of the web sites.

Myth #5: It is important to hire professionals for web designing

Undoubtedly, experienced web designers are better versed with the complexities of web designing than amateurs. Nevertheless, it does not mean that amateurs cannot learn and handle the tricks of the trade. With due time and continued devotion, amateurs may also try their hand at website designing and development. It is not the forte of professional designers only. If you are a novice and want to design and develop your website, by all means, go ahead and learn how to do it yourself.
