# **The Practicality Of Using The Electronic Mail System To Transmit Information**

E-mail or if you like, "electronic email," is the modern and popular method of communication which enables most people to remain connected right across the globe. It uses a series of protocols and programs which make it possible to formulate, transmit and get formatted information.

Email was initially used in business transactions but now it has become a sort of personalized way of passing and receiving information. In order for you to begin using your own private emails, you must register with an email server to permit you.

The electronic mail information is transmitted from one computer to the other between the sender and the recipient address using the internet. It works more or less like sending and receiving mail through a popular mail service. It can serve individuals, companies or can be customized in which case it will only have specialized information so some restrictions are used.

People are now using the emails to communicate with others across board with no distinctions at all, and are freely used by people of all ages, gender and race.

It is possible to think that the advancement of the internet technology has been responsible for the boom presently being witnessed in the use of emails, but wait a minute. Take time and consider the fact that it needs accessibility, availability and feasibility of using email for communication; so this latter factor is truer.

The internet has made it possible for the users to have email addresses where they can have endless availability of mail servers that give people numerous services.

People may choose from the host of servers but whichever one they are on, will be responsible for the swift delivery of mail from your address to the recipient in the same server or even in a different one.

Most of the servers do not charge anything for email service but it is good to check first because some do demand payment for their products.
