Boxes For Moving: Factors To Consider To Choosing The Best

Most of us experience moving at some point of our lives. For those who will experience moving for the first time, you need all the help you can get. First off, you need to know that there are a lot of tasks involve when you are relocating. But the most tedious of all is the packaging of your belongings. To make this process a lot easier, choosing the right boxes for moving is very important. By doing so, you can ensure that your things have the right protection during handling and transport. You can also use these boxes for other purposes after you're done unpacking.

The factors to consider when choosing good quality moving boxes are strength and size. To determine if a box is strong enough to protect its contents can't be determined unless you know what to put into it. As for choosing the size, you should also take into considerations the various sizes of the items to pack. In other words, in order to get the right boxes for moving make a list of the things you are going to pack.

While there are different sizes and strengths of moving boxes, it is possible to ensure safety and ease in handling and transporting if you use the right box. Consider the times the boxes are to be moved from one place to another. Why is this important? For example, a larger box that is full of heavy items is definitely difficult to move around than smaller boxes with heavy contents. Make sure that you consider this factor as well as it is one way of ensuring the safety of your belongings.

Additionally, make sure that your boxes for moving meet the industry standard of 200lb weight test. Depending on what you are packing, the boxes must pass the test that require greater weight-strength ratio. It will be easier if you buy only from a trusted supplier to make sure that you will get quality boxes.

Boxes for moving also come in different sizes. Having a large box does not mean it is strong and safe enough for its intended use. Size also matters! Not only for safety, that is, to avoid unnecessary movements if smaller things go into bigger boxes but, also to save costs when shipping. If your box is large enough that it hinders the plane or truck from carrying fewer items than it should, then expect an expensive shipping rate. A large light box costs more than a smaller box with the same weight. Take note however, that companies adjust their shipping rates accordingly based on this scenario.

The rate of packages such as boxes for moving is calculated either on their dimensional weight or actual weight. But the calculation that derives the greater amount is used. The dimensional weight formula calculates the amount of space that is occupied by a package relative to its weight - the volume or cubic size. This formula is used by the air-freight industry based on the volumetric standard of the International Air Transportation Association (IATA). Use the following formulas to get the package's dimensional weight:

In pounds: LxWxH (in inches), divided by 194 for domestic shipping; and 166 for international shipping.

For kilograms: LxWxH (centimeters) divided by 6000 for international shipping.
