The Importance Of Solenoid Valves

When we purchase items like washing machines, dryers, dishwashers or even coffee makers we don't really put much thought into what process had to occur for the product to be made. We give even less thought to exactly how these items work to make our lives easier. When you start to give some thought to the fact that without certain parts in each of these items they would not even work it becomes quite an amazing thing to look into. Among the many vital components in items such as this are the solenoid valves. Even that tiny coffee maker on your counter needs one to do it's job.

In the commercial world, regulations on things like this are pretty tight making the specifics of what you can and can not use limited at times. Plastic valves are fairly common when it comes to water control.

These plastic valves are most often made of PVC plastic so the risk of rust is eliminated. This is why they work so well in your garden hose when you're watering your grass or in your washing machine when it is leaning your clothes. Just about all household products that deal with water will have at least one of these valves.

There is also such a thing as an air solenoid valve. These are used for restricting or cutting off an air supply. The most popular application is to use them to auto regulate air pressure.

A lot of different companies make these valves, but there is no big difference between any of them. Brand name isn't very important here since the basic construction is unchanging throughout the industry. With so many companies making them they are very easy to get your hands on is you need to replace one and they won't cost you very much either.

By taking a little time to look into how they work you will be able to easily see why they are used so much in so many different products. They are very sturdy and can handle long term wear and tear making them perfect for commercial applications. They also have many other uses other than what it listed here.

By knowing all about how these valves work you can spot a faulty one from a mile away when it does wear out in one of your appliances. This ability makes replacing one also easy and the best part is that you won't be out a big bill for hire a repairman or having to replace the whole item. The money saving potential here is huge when compared to having to replace your coffee maker every couple of years.
