# **Find Out How To Save Money On Heating Bills With DIY Sash Window Insulation**

We are all looking for ways to save money. In these hard economic times we have become very innovative and often decide to do a lot of home improvements ourselves. How To save money on heating bills with DIY sash window insulation is what we want to know.

In heating your home you want to retain every ounce of heat that is generated. Today the heating prices are very high so you do not want to lose any heat through your windows. Your windows may not be as efficient as they should be so you should check them to see if they are leaking. By evaluating how they function, you will find out if it is only one window or many.

After evaluating which windows you have to work on you measure them so that you know the quantity of material you must purchase. The DIY, do it yourself, shops have all that you need. You can find a kit from your local area or online.

When starting this DIY project be sure to take care in taking off the beads and staff without damaging the beads. The documentation will illustrate how to remove the upper and lower sashes properly. The surfaces must be well cleaned since you are using adhesive. If the areas are not clean the adhesive will not bond properly.

Your sash window can now be seen and you can put in the seal that came with the kit to sash cord areas. You are now able to cut it to the right length. After you have put the seal into the frame you nail it into position.

In dealing with the central section, springs or V strips can seal that area. A liquid sealer is also available for any of those gaps that you find. Check to be sure that all windows move smoothly in the track. Finish the job by putting the window back into place.

There are film strips that are also effective. These films are used to fill in the gaps and can be applied to the outer frame. This is time saving as it involves a reduced amount of work. Further insulation can be achieved by using the film on the outer and sliding frames.

When you decide to start this project have the tools ready that you will need. You need to get a kit to begin with. The following are some tools you will need: windowsill angle finder, hammer, metal snips, pry bar, measuring tape, nail punch, and pliers. You will notice a difference once you have completed the job.

[Sash window draught proofing](#) will help the budget minded homeowner to save money on cooling and heating costs. The professionals can provide [sash window refurbishment](#) to bring your old windows up to modern standards.
