# **Web Design - An Integral Element Of The World Wide Web**

In a time where Google has replaced the local high street library as a source of information, the internet plays an active role in a person's day to day life. People no longer need to travel to their local libraries and search for hours to find a tiny bit of information. With the internet now being supported on devices like mobile phones and computers and an active internet connection being available in every corner, you don't need to go far to find information - it comes to you!

But do you know what goes into creating a web page? Web designing is a special field where data is to be distributed across the World Wide Web.

Now web designing has its own unique importance although initially created as a combination of internet communications like email & hypertext. The language of initially used for the creating of web pages was html-hypertext markup language that is allowed to create normal pages with headings, paragraphs and hyperlinks. Now appearance of torrents use very little time for the field to become competitive. Here are many comp companies that invested for the betterment of the language. On further development newer score languages like xhtml and xml were created. Long with the look of a web page began to modify with imagery, graphics and cascading style sheets (css).

But was it enough? No! There is always room for improvement. A major reason was the increasing craze of the internet and that it ceased to be just a "source of information". Instead internet was now a source of entertainment & business too. so soon plug-ins (a small computer program that adds to a larger application) such as Java Runtime Environment, Adobe Flash and Quick Time made it possible for the web pages to have animations, videos & sounds in them. Attractive? Yes, after all that was its purpose!

When the web pages were being read on different browsers, on different computers each with their own quirks on reading the css the problem was created. Now the layouts of css were introduced for running any computers with newer versions of browsers. But now there are many companies that use the old browsers like Internet Explorer 6 & Netscape Navigator 4 but now you should update with new browsers as soon as possible.

Now designing for the internet needed to have certain standards any other business and the web need to a relative and specific content of web designing. The web site has needed to appear with specialized & good-looking and websites need to find a search engines.

Now what web designing is today has become. Web site takes some hours of people to create what we access in seconds and during of these hours it work on the present and the future of information!
