# Windows Control Panels And Platforms

Recently, Windows Reseller web hosting has proved itself to be a more popular alternative compared with the Linux platform because of the numerous advantages and features that can be derived from using it.

1. With Windows platform, users can take advantage of a fantastic Microsoft web design application known as Active Server Page scripts. On top of this, users of Windows Resellers web hosting will be able to use many more tools that allow for active programming and many scripts that will meet their needs easily.

2. In Windows Reseller services, you will find RDMS (a relational database management system) being used which is a type of SQL server that is frequently used because of the great reputation it has as a high-level tool that has worked in projects all over the world, especially in projects where the reliability of the implementation is very important.

3. This option is a great choice for a Reseller business primarily because it is very usable and is also compatible with most of the host devices available, as opposed to Linux which has spottier coverage. For an example of this, you can consider that any websites that are run on a UNIX-based system will still be able to be hosted by a windows server, but if you have a Windows based page you will not be able to host it effectively in Linux.

4. One of the biggest reasons for using the Windows platform is its across the board compatibility. For this, we can look at a good example: you will only have to have a single control panel and from this you will be able to track multiple different clients at the same time which is much different from the Linux reseller web hosting schemes in which you would need to open multiple different control panels to accomplish this.

5. This method will allow for the use of ASP. service plan that comes with the Windows Reseller web host service. This is an added benefit to the clients because ASP and ASP.Net are powerful tools especially for web application development which helps to facilitate in designing and developing one's website for their business attraction.

6. Furthermore, Microsoft is providing SQL Server, a highly reliable and powerful software for data management and analysis which work fine with many existing complex business applications.
