Insights Into Certification In Microsoft VB Development

Finding the right training course to match the needs of industry is essential in these uncertain times. In addition, it's also necessary to discover one that you'll enjoy, that fits your character and ability level.

Whether it's office skills you're looking to polish up on, or would like to achieve professional IT certifications, there are technically advanced courses and back-up to help you get where you want to go.

Modern training methods at last enable students to study on an innovative style of course, that is far less expensive than old-style courses. The economies of scale of such training programs allows everybody access to them.

A number of people assume that the school and FE college path is the right way even now. So why are qualifications from the commercial sector becoming more popular with employers?

Corporate based study (as it's known in the industry) is more effective in the commercial field. The IT sector has become aware that a specialist skill-set is what's needed to handle an acceleratingly technical workplace. Microsoft, CompTIA, CISCO and Adobe dominate in this arena.

In a nutshell, only required knowledge is taught. It isn't quite as lean as that might sound, but the principle objective is to cover the precise skills needed (along with a certain amount of crucial background) - without overdoing the detail in everything else - in the way that academic establishments often do.

Just as the old advertisement said: 'It does what it says on the tin'. Employers simply need to know what they need doing, and then request applicants with the correct exam numbers. That way they can be sure they're interviewing applicants who can do the job.

Beginning with the idea that it's good to locate the employment that excites us first and foremost, before we're able to contemplate which method of training ticks the right boxes, how do we decide on the right path?

Since without any previous experience in IT, in what way could we understand what any job actually involves?

Deliberation over several factors is imperative if you need to discover the right solution that will work for you:

- * Your individual personality and what you're interested in - the sort of work-oriented areas you like and dislike.
- * For what reasons you're getting involved with Information Technology - it could be you're looking to overcome some personal goal such as self-employment for instance.
- * How highly do you rate salary - is an increase your main motivator, or does job satisfaction rate further up on the scale of your priorities?
- * With so many different sectors to gain certifications for in the IT industry - it's wise to pick up a basic understanding of what makes them different.
- * You have to understand what differentiates the myriad of training options.

To bypass all the jargon and confusion, and uncover the most viable option for your success, have an informal meeting with an advisor with years of experience; someone who can impart the commercial reality while explaining the certifications.

Many students come unstuck over one aspect of their training very rarely considered: The method used to 'segment' the courseware before being sent out to you.

You may think that it makes sense (with a typical time scale of 1-3 years for a full commercial certification,) for your typical trainer to courier one section at a time, as you pass each element. However:

What if for some reason you don't get to the end of all the sections or exams? What if you don't find their order of learning is ideal for you? Through no fault of your own, you may not meet the required timescales and therefore not end up with all the modules.

Put simply, the very best answer is to have a copy of their prescribed order of study, but to receive all the materials up-front. Everything is then in your possession if you don't manage to finish at their required pace.

Ask almost any skilled consultant and they'll entertain you with many awful tales of students who've been conned by dodgy salespeople. Ensure you only ever work with an industry professional who asks some in-depth questions to find out what's appropriate to you - not for their wallet! You need to find the right starting point of study for you.

If you've got any real-world experience or qualifications, you may find that your starting point is very different to someone completely new.

It's wise to consider some basic Microsoft package and Windows skills first. This can help whip your basic knowledge into shape and make the learning curve a little less steep.
