# **Understanding How To Operate An Espresso Machine**

An espresso machine is used to deliver steam at high pressure for making renowned espresso coffee. It is famous for its thickness which is generally higher than regular coffee. The amount of caffeine in it can be diluted by the use of latte or cappuccino. This can lighten the taste of the coffee that can be too strong for some individuals.

Before starting with coffee making, it is necessary to collect few things. Among the first things, one has to get water, beans and a grinder for them, and demitasse cups. Use of tap water has to be avoided as it can interfere with the taste. One needs to try getting cold filtered water for this purpose.

To start with, water needs to be poured into the water chamber. It needs to be ensured that boiler cap of water chamber is fastened securely after pouring water. An ounce of water is enough for making a single shot. Most of the times, it can accommodate water for four shots of the same.

Now, the coffee basket has to be positioned properly into the filter holder. These days, filters come along with such markings that can help in adding just the right amount of coffee.

The grounds present along the top and sides of the filter need to be removed. Now, it is the time to place the filter holder in the machine. The water would get heated in some time and made to go in the coffee grounds. Ideally, brown foam known as crema gets out from the designated outlet. When the color of the foam becomes white, it is the time to remove the cup.

The beans can be granulated for adding to the richness of the taste. In this way, an espresso machine can be used for making yummy espresso with a heavenly taste.
