Finding Good Host For Drupal

Drupal is in no time becoming one of the most fantastic CMS' available today. With time many modules have been created for drupal and they all can be downloaded at Drupal's main site.

Choosing a cheap Drupal host is a great idea for people who are testing Drupal for the first time, or who want to run a number of small visitor websites. Lately there are web hosts that are offering very cheap shared hosting. But the problem with shared hosting is that you will be very restricted with bandwidth, space and databases.

Before starting any site in Drupal be sure that you have found the best web host that will suite your needs. After you are finished configuring your site, having to move from one host to another is very time consuming task. If your website is media rich you will have lots of support files that need to be moved from the old web host to the new web host. This takes plenty of time. Is very common when you finish moving your site something is not working after you have finished moving your files. If your website earns revenue then your business will be effected.

Factors to consider when choosing a web host include:

1. Bandwidth - Maybe now your site is not having a lot of visitors, but you need to think for the future. Many in the future you will have many visitors viewing your site. Costs are generally high if you go over your allowed limit.
2. Cost - For cheap Drupal hosting you want a good value package. Currently US\$4 is considered is cheap, but you can find even cheaper shared hosting.
3. Limit of domains - how many domains does the package allow per account? If you plan to install more then one web site that you should get plan with unlimited number of domains.
4. Limit of databases - if you have lots of domains will need a similar amount of databases. Consider that every new Drupal site will need separate database.
5. Disk Space - How much space will you get with the plan that you will purchase. Maybe you site is small now but will time will grow and will need more space. Will it be enough for the future of the web site? Expect to get unlimited disk space, which in effect equals 1,000 GB, gigabytes of storage.

One of the best features with Drupal is that you can run many sites from just one Drupal installation. This is very useful if you plan to run many web sites from one single account. This way when you update one module or theme automatically is updated for all of your sites. This makes the maintenance of the installation less time consuming. Even the cheap hosting hosts allow you to run multiple websites from a single account.

All cheap Drupal hosting hosts will configure their hosting on shared computers. These shared servers run multiple accounts on a single computer. Your package will sit with other accounts on the server and share the resources. The good thing is that the price is kept low. The disadvantage is that the other peoples sites will disturb the performance of your site. As a general rule you can comfortably run Drupal websites expecting 1,000 unique visitors per day. If your Drupal website enjoys more than this many readers, then you should consider dedicated or VPS hosting.

Shared hosting if very cheap and you can hosting your site for prices lower then US\$4. Check this [arvixe coupon](#) for cheaper hosting with Arvixe or this [godaddy coupon](#) for cheap Drupal hosting.
