Windows Linux And The Bottomline

Windows web hosting is one of the more famous solutions offered to individuals and organizations who want their presence felt in the worldwide web. A good number of web hosts or companies are using Windows-based web hosting in view of the many benefits that using a windows hosting service can offer.

The use of Microsoft's Windows software makes windows hosting popular among a growing number of individuals and organizations. A windows-based webhosting provider uses Microsoft Windows as the primary software in running its servers. In turn, the OS permits hosts that are Windows-based to offer their clients applications which are Microsoft-licensed such as but not limited to Visual Basic and ColdFusion.

Customer support for websites created with FrontPage is guaranteed due to its no-nonsense approach to hosting. On others hosts that are Unix/Linux-based, there is still the need to verify if the FrontPage extensions used by the company's site is supported. In practice, Unix/Linux-based web hosts do not at all support other Microsoft applications, which scenario can indeed pose serious problems for customers.

In terms of writing pages, both serve Java Script and HTML pages. Usually, servers that are Windows based utilize files *.htm named while Linux servers use files *.html, but the same is a matter of preference, actually. Frontpage extension are likewise not exclusive to Windows servers as is typically believed, for there are also servers that are Linux-based that include such service in their package as well.

In terms of CGI, CGI and Peri access is more on the Linux side, than Windows. Depending on your needs, make sure that your web hosting service has them.

Another great perk that is included is bandwidth. Defined, bandwidth refers to the extent of the quantity of traffic of data that happens between and among all other sites in the internet and your website. The quicker that the pictures, sounds and videos load, the more satisfaction it brings to customers.

A site that desires to be dynamic must have a database. The databases that are popular are mySQL and Access. While mySQL and Access can be found on Windows servers, Linux-based hosting cannot offer Access.

Having gone to the preliminaries, we go back to the question of windows web hosting. First of all, it is not web hosting that is Linux, Macintosh, or Unix based. Based on general observations, Linux-based hosting is more popular of the three above mentioned in view of the fact that it is relatively affordable and it is easy to install.

In terms of security, a few will assert that Windows servers are more susceptible than Linux ones, however, that is not true. In reality, both Windows servers and Linux servers have security problems. More importantly, security is an issue that is more appropriately a concern of the administration of the host. However, should problems arise, the Windows platform is more able to provide the needed support, compared with Linux. That is the edge that Windows based hosting offers. Hence, since every website needs all the support that it can get when problems arise, and Windows hosting that are created with FrontPage are assured of support, Windows based hosting appears to be the more prudent choice.
